

Ultimate Tech Placement Blueprint

From Campus to Career: The Only Resource Guide You Actually Need

About ME

Hey, I'm Shubham 7+ years in tech, 100+ interviews on both sides of the table.

Career path: Infosys → Pubmatic → Amazon → Coursera (currently WFH)

I've cracked multiple high-paying offers across India and internationally using the exact playbook below.

Connect 1:1 - [Here](#)

Here's everything broken down by importance

The Big 6 That Matter

1. DSA Your Interview Superpower

Real talk: Miss this, miss everything. 90% of tech rounds = DSA rounds.

Master these:

Fundamentals: Arrays, Strings, LinkedList, Stack, Queue

Advanced: Trees, Graphs, DP, Recursion, Backtracking

Must-know: Sliding Window, Two Pointers, Binary Search patterns

What

Where

Learn

[Striver A2Z Sheet](#)

Pattern

<https://www.youtube.com/watch?v=1m04uYyyZgg>

Grind

NeetCode 150 → LeetCode → Codeforces

Pro move: This sheet is more than enough, Don't memorize solutions. Learn the pattern once, apply everywhere.

Interview ammo: [Leetcode 150Questions](#) + [Blind 75](#)

2. OOP — The "Can You Code?" Test

Why: Every single language uses this. Skip it = instant red flag.

Core concepts:

The Big 4: Encapsulation, Inheritance, Polymorphism, Abstraction

Bonus: SOLID principles (makes you look senior)

What	Where
Theory	Apna College / Kunal Kushwaha Java
Practice	Code real examples in your preferred language
Javascript	Namaste Javascript

3. DBMS : The Silent Killer Round

Truth bomb: Every product company asks this. Banking/fintech? 100% guaranteed.

Non-negotiables:

SQL Queries (Joins are everywhere)

Normalization (1NF to BCNF)

Transactions & ACID properties

Indexing & optimization

What	Where
Concepts	Gate Smashers (clearest explanations)
SQL Practice	LeetCode SQL 50 / HackerRank SQL
Hands-on	Install MySQL Workbench, run actual queries

Cheat code: Companies love candidates who've touched a real database. Add "Created and optimized SQL queries" to your resume.

4. Operating Systems — The Fundamentals Check

Why it's asked: Separates CS grads from bootcamp kids.

Focus areas:

Process vs Thread (most asked)

CPU Scheduling algorithms

Deadlock (conditions + prevention)

Memory Management (Paging, Segmentation)

What

Where

Video

[OS](#)

Notes

[OS Interview Bible](#)

Practice Draw diagrams for every concept

Secret weapon: Most candidates fumble process synchronization. Master it = instant edge.

5. Computer Networks — The Backend Essential

Reality: Backend role? You're getting grilled on this.

Hit list:

OSI vs TCP/IP (explain like you're teaching a 10-year-old)

HTTP/HTTPS, DNS, Subnetting

3-way handshake (everyone asks this)

What

Where

Learn [Here](#)

Revise [GFG](#)

Pro tip: Visualize packet flow. Draw it out. Interviewers eat that up.

6. Development — Your Proof of Work

Cold hard truth: Theory gets you to the interview. Projects get you the offer.

Pick your poison:

Web: React + Node + MongoDB (most jobs here)

Mobile: Flutter (one codebase = iOS + Android)

AI/ML: Python + Scikit-learn (hot market rn)

Blockchain: Solidity (fewer jobs but insane pay)

What

Where

Web Dev [Chai aur Code / Hitesh Choudhary](#)

Game changer: Build 3 projects:

One CRUD app (shows basics)

One with API integration (shows real-world skill)

One deployed live (shows you ship code)

Host them: Vercel (frontend) + Render (backend) = free hosting

AI/ML — Your Future-Proof Skill

Real talk: AI is eating the world. Companies are throwing money at people who can build, train, and deploy models.

Master these:

Foundations: Python, NumPy, Pandas, Statistics, Linear Algebra

Core ML: Regression, Classification, Clustering, Scikit-learn

Deep Learning: Neural Networks, CNNs, RNNs, Transformers,
PyTorch/TensorFlow

Specialized: Computer Vision, NLP, or GenAI (pick one, go deep)

What

From

Learn

[Krish Naik ML Playlist](#) / [Andrew Ng's ML Course](#)

Hands-on Kaggle Learn → Google Colab → Fast.ai

Projects Build + Deploy on Streamlit / Hugging
Face Spaces

Pro move: Theory without projects = useless. Build 3-5 real projects, deploy them live, add GitHub links to resume.

Reality check: 70% of ML work = data cleaning. Master Pandas and data preprocessing before diving into fancy neural networks.

International Opportunities

The gold mine: [GitHub Internship Repo](#)

Updated daily with US/Europe/Canada positions

Filter by: New Grad / Intern / Remote

Salaries: \$40-80/hr (internships) | \$100k+ (full-time)

Pro move: Apply early (August-October for summer internships). Early bird actually gets the worm here.

The Execution Plan

Week 1-4: DSA (2 hours/day)

Week 5-6: OOP + DBMS (1 hour each)

Week 7-8: OS + CN (1 hour each)

Week 9-12: Development projects

Throughout: Revise previous topics 30 mins daily

Reality check: This isn't a sprint. Consistent 2 hours > random 10-hour days.

Final Words

These 6 subjects cover 90% of what actually comes up in tech interviews.

Master them → you'll land interviews → clear the rounds → bag the offers.

It's honestly that straightforward (not saying it's easy, but it's not rocket science either).

Stop hoarding bookmarks. Start actually doing the work.

— Shubham 🙌

P.S. — *Saved this guide? Cool. Now actually use it. Take screenshots of your progress and tag me. Let's crush this together.*
